

1. CURRICULUM VITAE

Prof. Dr. Gabriele Sabbioni

ausserplanmässiger Professor (University of Munich)
Origins: Lugano (Switzerland)

Research Address: Alpine Institute of Chemistry and Toxicology (AICT), CH-6718 Olivone. Email: gabriele.sabbioni@bluewin.ch
Consulting address: Institute of Environmental and Occupational Toxicology, CH-6780 Airolo.

Teaching Address: Walther-Straub-Institute of Pharmacology and Toxicology, Ludwig-Maximilians-University, D-80336 Munich. Email: gabriele.sabbioni@lrz.uni-muenchen.de

Education

University of Bern, Bern, Switzerland;	Masters,	Chemistry.
University of Bern, Bern, Switzerland;	High School Teacher Diploma,	Chemistry.
University of Bern, Bern, Switzerland;	Dr.phil.nat.,	Chemistry.
University of Toronto, Toronto, Canada;	Postdoctoral,	Chemistry.
M.I.T., Cambridge, MA, USA;	Postdoctoral,	Toxicology.
University of Würzburg, Würzburg, Germany; Dr.med.habil.,		Toxicology.

Professional Experience

University of Bern, Department of Chemistry, Bern, Switzerland. Graduate student fellowship.

University of Toronto, Department of Chemistry, Toronto. Postdoctoral fellow.

Massachusetts Institute of Technology, Applied Biological Sciences, Cambridge, MA.

Postdoctoral fellow.

University of Würzburg, Department of Toxicology and Pharmacology, Würzburg, Germany.

Head of a research group.

University of Munich, Walther-Straub Institute for Pharmacology and Toxicology, Munich, Germany. Professor non-tenure track.

2003-2006 Institute of Environmental and Occupational Toxicology, Airolo, Switzerland.

Since 2003- University of Munich, Walther-Straub Institute for Pharmacology and Toxicology, Munich, Germany. Adjunct Professor (ausserplanmässiger Professor).

2007-2014 Tulane University, New Orleans, LA. Associate Professor.

Since 2015 Consultant and research in Switzerland at the Institute of Environmental and Occupational Toxicology, Airolo; and Alpine Institute of Chemistry and Toxicology, Olivone.

Present teaching activities

Presently, I am participating in the courses “Experimental pharmacology and toxicology for medical students, biologist und chemist” and “Practical exercises in pharmacology and toxicology” (= 4 weeks practicum) from the University of Munich (Germany).

Research curriculum

After studying chemistry in Bern (Switzerland), I performed my first postdoctoral work in the field of bioorganic chemistry at the University of Toronto. I started to work on topics of toxicology at the Division of Toxicology of the Massachusetts Institute of Technology (MIT). In cooperation with other groups, we could demonstrate that blood protein adducts of aflatoxin are good markers of exposure and good markers of the target dose (liver DNA). At the University of Würzburg I refined the method for the analysis of aflatoxin albumin adducts in humans. We were able to find such adducts in humans living in regions with high liver cancer incidences: Africa and China.

In Würzburg and Munich I pursued my biomonitoring studies with other chemicals such as: nitroaromatics, aromatic amines, isocyanates, urea and carbamate pesticides, cyproterone acetate and leflunomide. After developing the methods in rat experiments, we quantified blood protein-adducts and urinary metabolites in workers. In some studies we were able to compare the air levels, the urinary

metabolites and the protein-adducts with the individual genotypes (N-acetyltransferase, glutathione transferases), with the early biological effects (cytogenetic) and with biological effects (liver disease, exposed to the following compounds. At Tulane University we developed methods to determine isocyanate specific biomarkers in workers exposed to 4,4'-methylenediphenyl diisocyanate and toluene diisocyanates. We applied the methods to samples obtained from different laboratories. Recently we created and established a method to quantity serum albumin adducts of isothiocyanates released from cruciferous vegetables. We studied following populations:

1. Workers accidentally exposed to toluene diisocyanates, Netherlands.
2. Population study to monitor the consumption of cruciferous vegetables, Italy.
3. Workers exposed to methylene-, toluene- and hexamethylene-diisocyanates, Germany, and Cincinnati, USA.
4. Workers from a isocyanate factory exposed to 4,4'-methylenediphenyl diisocyanate in Germany.
5. Workers from a factory manufacturing products with polyurethane in Germany.
6. Workers from construction sites exposed to polyurethanes in Germany.
7. Workers exposed to 4,4'-methylenedianiline in Germany.
8. Workers from a rubber factory exposed to 2-methylaniline and aniline, USA.
9. Workers from two Chinese ammunition factories exposed to 2,4,6-trinitrotoluene.
10. Workers exposed to ammunition waste in soil, Germany.
11. Workers exposed to dinitrotoluenes in China.
12. Workers exposed to 4-chloronitrobenzene in China.
13. Workers exposed to benzidine and azodyes in India.
14. Field workers exposed to pesticides, Sanremo, Italy.
15. People exposed to aflatoxins, China, Kenia, Gambia.

In order to analyze DNA-adducts of carcinogens in vivo, we have synthesized several deoxyguanosine adducts of arylamines. We developed methods such as HPLC/MS/MS, HPLC-ECD, and ^{32}P -postlabeling, for low level detection of DNA modifications in vivo.

For the prediction of the mutagenicity, toxicity, and carcinogenicity, we studied the physico-chemical properties of several heterocyclic arylamines, arylamines and nitroarenes. In structure activity studies we determined the electronic parameters which show a correlation with these biological endpoints.
